SOFTWARE PLAGIARISM DETECTION IN MULTITHREADING USING MACHINE LEARNING

Presented by : Anju Sreekumar

Guided by : Dr.Sabitha S

March 23, 2021

COLLEGE OF ENGINEERING TRIVANDRUM

OVERVIEW

INTRODUCTION

INTRODUCTION

- The Software plagiarism, which arises the problem of software piracy is a growing major concern nowadays.
- The customers may develop a modified version of the original software in other types of programming languages.

MOTIVATION

MOTIVATION

- The Software plagiarism,It is a serious risk to the software industry that gives huge economic damages every year.
- GPL (GNU General Public License) allows users to modify GPL compliance programs freely, as long as the derivative works also follow the tenets of GPL
- However, driven by commercial interests, some companies and individuals incorporate third party software without respecting the licensing terms.

EXISTING SYSTEM

EXISTING SYSTEM

- Today software birthmark approaches are available, are applicable only to sequential programs
- Existing birthmark generation and comparison are no longer applicable to modern software with multiple threads.

PROPOSED SOLUTION

PROPOSED SYSTEM

- Proposed a methodology for software plagiarism detection in multi-programming languages based on machine learning approaches.
- Software birthmarks have been proposed as a method for enabling the detection of programs that may have been stolen by measuring the similarity between the two programs.
